Whitelist Function Clarification Statement

Purpose of the Whitelist Function

The BABEDINO token smart contract includes a whitelist function that was implemented briefly during the initial deployment phase. It served as a temporary anti-sniping protection mechanism to prevent bots or whale addresses from manipulating early trades before liquidity was added and locked. This mechanism was used only during deployment and never during public trading.

Current Status of the Whitelist Function

The whitelist logic is now **permanently disabled and non-functional**. Specifically:

- The whitelistEndTime variable is hardcoded as 0, which means no whitelist condition can ever be triggered.
- Although whitelistEnabled remains set to true (visible on BscScan), it has no effect because the associated logic depends entirely on a valid whitelistEndTime.
- Ownership of the contract was renounced shortly after deployment. Therefore, **no wallet can ever activate or change the whitelist settings**.

Privileges and Fairness

No wallet — including the deployer, helper contracts, or team members — has ever received any advantage such as:

- Bypassing transaction limits
- Gaining early access to trade
- Receiving fee or tax exemptions
- Interacting with disabled functions

All trading on BABEDINO is public, permissionless, and equal for all participants.

Permanent Safety Measures

- ✅ No tax, commission, or transaction fee has ever existed in the contract
- ✅ Liquidity is locked via Pinksale
- ✅ Ownership has been renounced permanently
- ✅ Token supply is fixed, and no mint function exists
- ✅ All transactions are publicly visible on BNB Chain

Why a Warning May Still Appear

Some automated token scanners (e.g., TokenSniffer, GoPlus, DappBay) may still show a warning about the presence of a whitelist function. This is a **false flag** caused by static code analysis — not by actual contract behavior.

In practice:

- The whitelistEndTime is 0 (disabling the whitelist logic permanently)
- The contract cannot be modified (ownership renounced)
- No wallet has any advantage, and whitelist conditions never execute
